

SINGLE TRAP SOLUTIONS

For wildlife or rodent control where you are monitoring an isolated trap, or when your traps are more than a few thousand feet away from each other, Trapmate provides the Trapmate Kiwi line of reusable single trap solutions.

Combining dual-sensor functionality with a direct cellular connection along with being self-powered, the Trapmate Kiwi's are a key part of the toolkit for anyone in the trapping business.

TRAPMATE KIWII

The Trapmate Kiwi is the gold standard of single-trap electronic remote monitoring devices. Combining a magnet sensor (reed switch), an accelerometer and a direct cellular connection, the Kiwi is the best choice for monitoring single traps at a distance.

The Kiwi can monitor traps in any location that receives even a weak cellular connection from the Verizon network. Lightweight, rugged, and powered by replaceable off-the-shelf batteries, the Kiwi and its dual-sensor capabilities provide almost 100% reliability in detecting a capture.

TRAPMATE KIWII PLUS

The Trapmate Kiwi+ (Kiwi Plus) extends the battery lifetime and improves on the durability of the original Kiwi. It's an all-in-one battery-powered device that combines two sensor mechanisms, a magnetic reed switch and an accelerometer, to detect when animals are in your traps, with virtually no false positives or negatives.

The Kiwi+ offers up to a 5-year battery life for each set of AA batteries. The batteries are more easily replaceable than they were with the original Kiwi. In addition, the Kiwi+ features an improved and more rugged case design to protect the Kiwi+ from harsh conditions.
